Lecture 1 - Numbers and Notation

Robert Lowe

Division of Mathematics and Computer Science
Maryville College

Outline

Quantitative Language

Evaluating Expressions

Outline

Quantitative Language

Evaluating Expressions

 You have been taught a litany of rules and procedures, but no ideas.

- You have been taught a litany of rules and procedures, but no ideas.
- Your textbooks were lacking in text. Lots of color, lots of problems, no substance!

- You have been taught a litany of rules and procedures, but no ideas.
- Your textbooks were lacking in text. Lots of color, lots of problems, no substance!
- Being bad at math was socially acceptable, and you seized the opportunity because memorizing rules and procedures is boring.

Ancient Numeral Systems - Roman Numerals

Ancient Numeral Systems - Roman Numerals

Representing Numbers as Figures

Ancient Numeral Systems - Roman Numerals

- Representing Numbers as Figures
- Example: Roman Numeral System

Numerals		Transitions	
Ι	1		
V	5	IV	4
X	10	IX	9
L	50	XL	40
С	100	XC	90
D	500	CD	400
М	100	CM	900

• Arithmetic was usually done with some sort of manipulative aid (counting board, abacus, etc).

- Arithmetic was usually done with some sort of manipulative aid (counting board, abacus, etc).
- Roman numeral arithmetic is difficult. (Let's Try it)

- Arithmetic was usually done with some sort of manipulative aid (counting board, abacus, etc).
- Roman numeral arithmetic is difficult. (Let's Try it)

$$0 I + I = ?$$

- Arithmetic was usually done with some sort of manipulative aid (counting board, abacus, etc).
- Roman numeral arithmetic is difficult. (Let's Try it)

- Arithmetic was usually done with some sort of manipulative aid (counting board, abacus, etc).
- Roman numeral arithmetic is difficult. (Let's Try it)

 - 2 III + I =?

- Arithmetic was usually done with some sort of manipulative aid (counting board, abacus, etc).
- Roman numeral arithmetic is difficult. (Let's Try it)

- Arithmetic was usually done with some sort of manipulative aid (counting board, abacus, etc).
- Roman numeral arithmetic is difficult. (Let's Try it)

$$0 I + I = ?$$

$$\bar{2}$$
 III + I =?

$$\bullet$$
 V × IV =?

$$1 + 1 = ?$$

$$\mathbf{0} \ 1 + 1 = ?$$

$$\mathbf{2} \mathbf{3} + \mathbf{1} = ?$$

- Works very well for arithmetic!
 - 1+1=?
 - 2 3 + 1 = ?

$$1+1=?$$

$$2 3 + 1 = ?$$

$$4 5 - 1 = ?$$

$$\mathbf{0} \ 1 + 1 = ?$$

$$2 + 1 = ?$$

$$4 5 - 1 = ?$$

$$5 \times 4 = ?$$

Outline

Quantitative Language

Evaluating Expressions

• Fundamental operations: +, −, ×, ÷

- Fundamental operations: +, −, ×, ÷
- Alternate notations for multiplication: 3×5 , $3 \cdot 5$, 3(5), $3 \cdot 5$

- Fundamental operations: +, −, ×, ÷
- Alternate notations for multiplication: 3 × 5, 3 ⋅ 5, 3(5), 3 * 5
- Alternate notations for division: $4 \div 2$, $\frac{4}{2}$, $2)\overline{4}$, 4/2

 Convention PEMDAS - Parenthesis, Exponent, Multiply, Divide, Add, Subtract

- Convention PEMDAS Parenthesis, Exponent, Multiply, Divide, Add, Subtract
- Multiplication and Division are the same operation, so is Add and Subtract

Ties are broken left to right

- Convention PEMDAS Parenthesis, Exponent, Multiply, Divide, Add, Subtract
- Multiplication and Division are the same operation, so is Add and Subtract

Ties are broken left to right

• Example: $3^2 + 4 \times 2 - 16 \div (2 + 2)$

 Writing very large or very small numbers is very error prone.

- Writing very large or very small numbers is very error prone.
- We usually only really care about the first few values (more on this later).

- Writing very large or very small numbers is very error prone.
- We usually only really care about the first few values (more on this later).
- Base 10 gives us a way to do this!

- Writing very large or very small numbers is very error prone.
- We usually only really care about the first few values (more on this later).
- Base 10 gives us a way to do this!
- Large numbers have 0's at the right hand side. This is effectively multiplying by 10. So we can use exponents:

$$1,200,000 = 1.2 \times 10^6$$

- Writing very large or very small numbers is very error prone.
- We usually only really care about the first few values (more on this later).
- Base 10 gives us a way to do this!
- Large numbers have 0's at the right hand side. This is effectively multiplying by 10. So we can use exponents:

$$1,200,000 = 1.2 \times 10^6$$

 Small numbers of 0's between the decimal point and nonzero digits. This is effectively dividing by 10:

$$0.0000012 = 1.2 \times 10^{-6}$$
